

A How much does the protocol hold out?

B What the remaining overlap buys

■ B1 · per-pair mean (no chemistry) ■ MLP · embeddings + cell ■ pathway model

Protocols ordered by combination overlap. Where overlap is high, a predictor with no molecular information of any kind (B1) is competitive with — under leave-cell-line-out, better than — neural models. Only when combinations are held out does the ordering become interpretable. Mean $\pm$ s.d. over seeds.
